for a complete menu and

daily specials.

Enjoy your meal!
and which can occur upon expiration or at some other time during the period of the option.

The exercise of the option requires payment of a premium, which is typically a percentage of the market value of the underlying security. If the option is exercised, the holder is entitled to receive the difference between the market value of the underlying security and the strike price of the option. Conversely, if the option is not exercised, it expires worthless.

The value of an option is determined by a number of factors, including the price of the underlying security, the strike price of the option, the time remaining until expiration, and the volatility of the underlying security. These factors are used to calculate the theoretical value of the option using a mathematical model known as the Black-Scholes model.

In summary, options are a valuable tool for investors seeking to manage risk or speculate on the future performance of an underlying security. By understanding the basic principles of options, investors can make informed decisions about how to use these financial instruments to their advantage.
